Client: AGME Representative.

Project Vision Statement:
By the end of development, our goal is to create an online appointment booking system belonging to an AGME representative, providing customers with 24/7 access to book appointments with service providers, who may set up their own time slots within the system. Our aim is to make the system extensible such that any service provider can set up bookings regardless of their business, with the addition of an API that allows for integration on their website.

Project Stakeholders:
- AGME Rep / Product owner
- Customers
- Businesses / Service providers
- Employees of businesses

The Definition of Done for this project is as follows:

DEFINITION OF DONE:
A task is deemed complete once tests including a **peer review** of code and unit tests have been passed, the code has been committed in an individual branch, a pull request has been created, and is ready for merging.

Peer review: the team has looked over code to look for bugs and errors, before it is merged. In this review process code structure that would slightly improve efficiency is prioritised less if other work is still to be completed.
